

One complete ADMM iteration ($\sigma = 5.0$, $\mu = 30.0$)

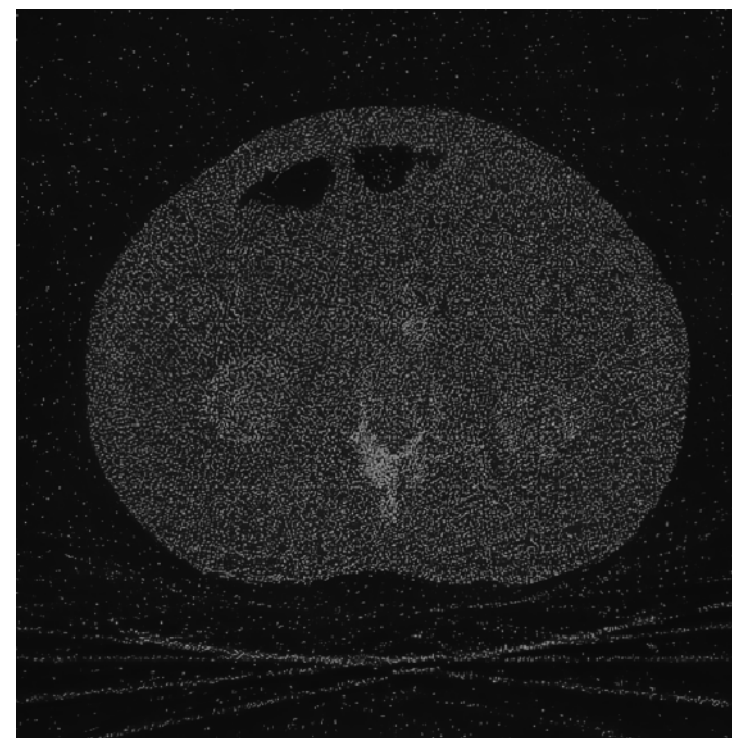

FBP x_0
PSNR = 14.2 dB

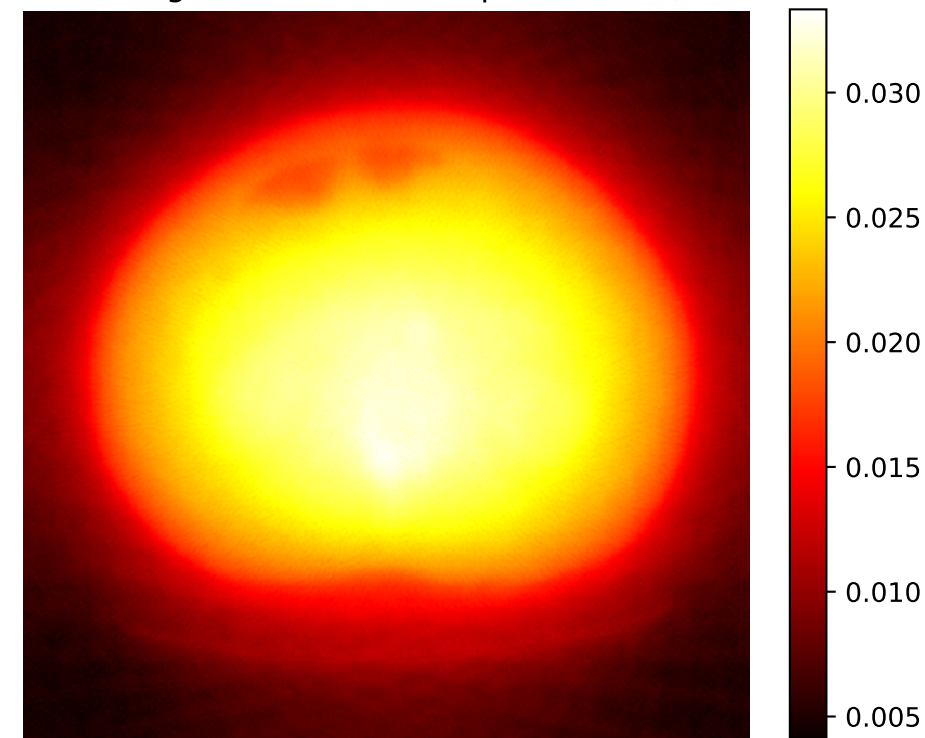

x-step input: $z - u$
(what the denoiser sees)

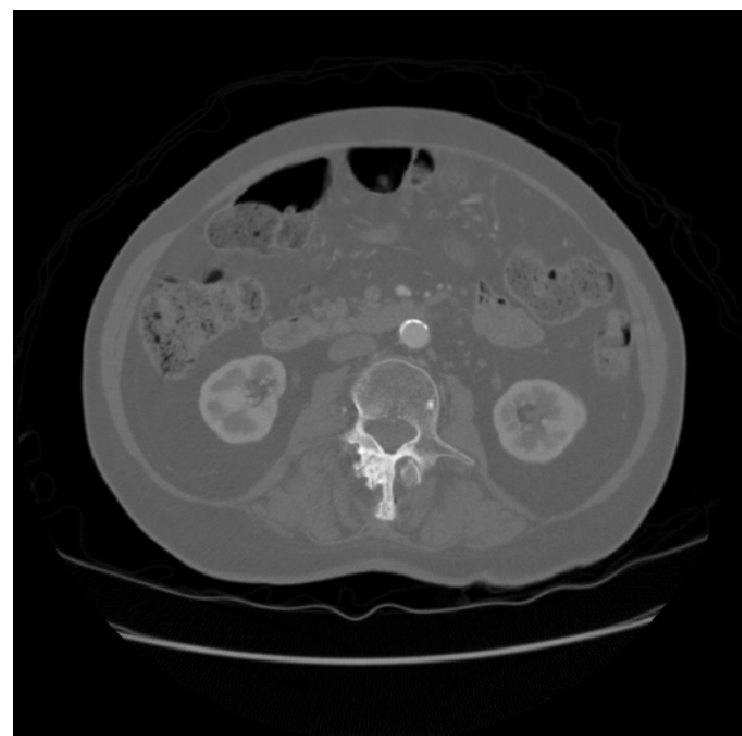

z-step target: $x + u$
(what data fidelity pulls toward)

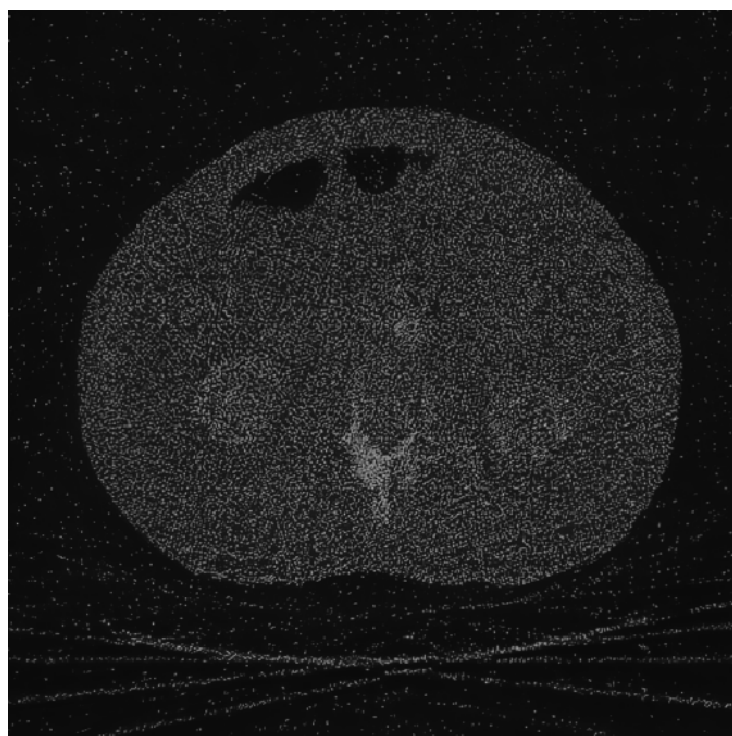

$|x - z|$ after one iteration
(disagreement between prior & data)

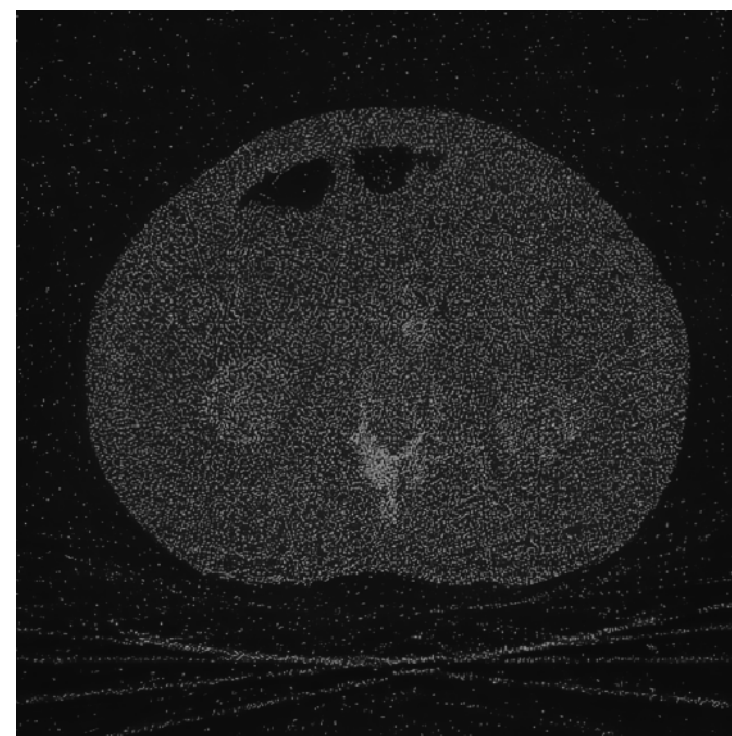

Ground truth

After x-step (DRUNet $\sigma=5.0$)
PSNR = 16.3 dB

After z-step (data fidelity)
PSNR = 16.6 dB

Dual variable u
(accumulated disagreement)
